

Fissure Sealing

Dental Department

What are fissure sealants?

Fissure sealants are a safe and painless way of protecting your child's teeth from tooth decay. It is a plastic coating which covers the chewing surfaces of the back adult teeth. The sealant creates a hard shield that keeps food and bacteria from getting into the tiny grooves on the surface of teeth. Most tooth decay in children occurs in the back teeth. Only 4 permanent teeth are sealed.

How are fissure sealants applied?

It is a painless, quick and straight forward procedure, taking only a few minutes per tooth, just like painting your tooth with a paintbrush.

How long do they last?

They can last for many years.
